

# Blockly guide

# code your own robot

- familiarize with the block programming environment.
- First simple projects, like programming a dance with Otto.
- learn the concept of sequential thinking and conditionals.
- make a complicated project, Otto must carry out a determined action.

install the software with the examples in: <https://www.ottodiy.com/#blockly>

move forward speed normal

dance moonwalker left speed normal size normal

do swing speed normal size normal

gesture happy

sound cuddly

Blocks

Loop

if distance [cm] < 15

then

gesture confused

repeat 3 time

move turn left speed normal

move forward speed normal

Blockly

```
#include <US.h>
#include <Otto9.h>
Otto9 Otto;

int distance;
bool obstacleDetected = false;

#define PIN_Trigger 8 // ultrasound
#define PIN_Echo 9 // ultrasound
#define PIN_YL 2 // left leg, servo[0]
#define PIN_YR 3 // right leg, servo[1]
#define PIN_RL 4 // left foot, servo[2]
#define PIN_RR 5 // right foot, servo[3]
#define PIN_Trigger 8 // ultrasound
#define PIN_Echo 9 // ultrasound
#define PIN_Buzzer 13 //buzzer

void setup() {
  Otto.init(PIN_YL, PIN_YR, PIN_RL, PIN_RR, true, A6,
)

void loop() {
  if (Otto.getDistance() < 15) {
    Otto.playGesture(OttoConfused);
    for (int count=0 ; count<3 ; count++) {
      Otto.turn(1,1000,1); // RIGHT
    }
  }
  Otto.walk(1,1000,1); // FORWARD
}
```

**Structure:** Start or stop or create a loop in the program.

**Time:** used to delimit the program over time.

**Otto and Humanoid specific movements, sounds and gestures.**

**Logic:** create conditionals, repetitions and logic programming.

**Math:** make calculations or to insert numbers.

**Function:** create a procedure that can be repeated.

**Variable:** A variable is a named value that can be changed.

**Sensor:** interact with the environment with multiple sensors.

**Motor:** move a servo motor or activate a regular DC motor.

**Display:** turn on or off multiple types of LEDs or matrix or screen.

**Audio:** emit a sound (with an mp3 player or a buzzer-piezo).

**Communication:** with certain modules. Bluetooth or Serial.

**Text:** insert text into the program.

# parts of a robot

- difference between sensors and actuators.  
(inputs vs outputs)
- where is the brain of the robot?
- what is a servomotor?
- can Otto talk?
- how does Otto see?
- other components & interactions.

# every robot has basically 3 component groups:

**sensors (INPUTS)**  
able to interpret  
information.

**processor system**  
a “mini computer”

**actuators (OUTPUTS)**  
produce the effect  
programmed.

**we could say that the sensors are the robot's senses, these transmit information to the processor that allows to alter the function performed by actuators.**

**in addition a robot will need a power source to function and a physical structure to support the elements that compose it and perform its functions.**

## how does a robot think?

- think (process) one thing at a time, he can't do two things at the same time.
- think and repeat actions very quickly, so much that sometimes we can't even see what he is doing and you have to tell him to wait a bit.
- he never does anything you haven't told him, you have to program everything, whatever you want he to do and give him the orders one at a time.
- normally, when a robot finishes its list of orders, it returns to start over, repeating your programming over and over again. (Loop)

```
010010101111101  
101010101011011  
010010000010101  
100000101011011  
110010101010111
```

**what is a servomotor?**

is an actuator that can rotate (usually between  $0^\circ$  and  $180^\circ$ ). it is used to control the angular position, at neutral can rotate  $90^\circ$  to the left and  $90^\circ$  to the right. (forced beyond this and they will break)

Otto has 4 servo motors that collectively help the robot walk and dance.

**servomotor includes 3 pins:**

**VCC power pin** (typically red)  
connects to **V (+5V)**

**GND ground pin** (typically brown or black)  
connects to **G (0V)**

**PWM signal pin** (typically orange or white)  
receives the control signal,  
connects to the **S** of a determined pin  
number.

**it comes with 3 screws:**

**2 for mounting (long & pointy)**

**1 for center horn short & flat)**

**and**

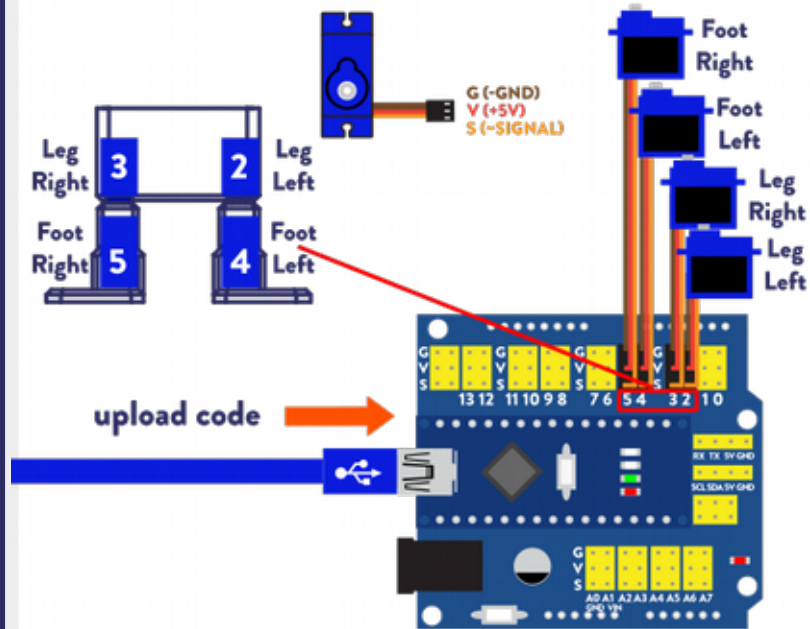

**3 horns/ arms “white keys”**

**we only need 1 per servo.**

**time to code again!**

## servos wiring

## example servo control (align center)

**walk before run**

## 2 walk examples

what is the difference?

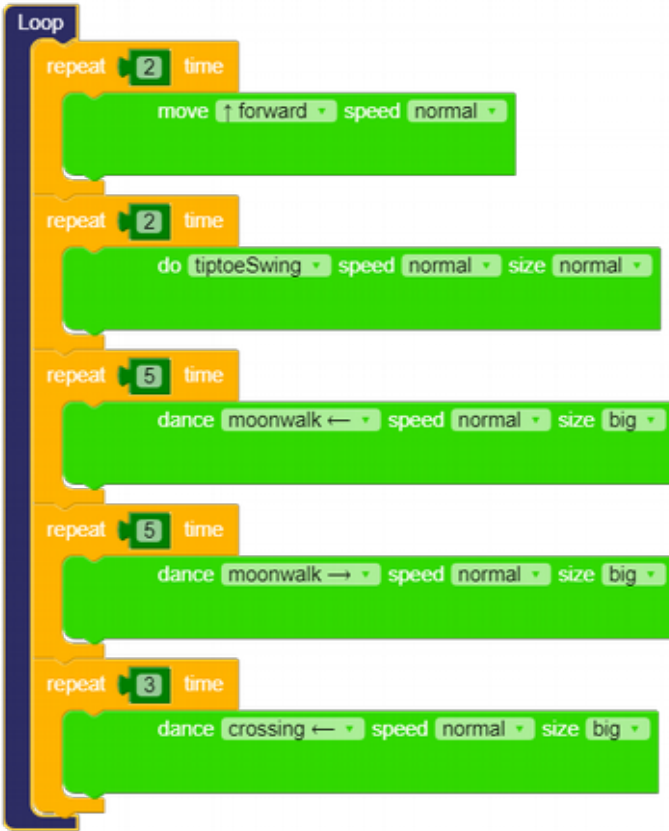

Otto.walk(1,1000,1);

**can you make Otto run?**

**dance time!**

**Otto.walk(2,1000,1);**

**Otto.tiptoeSwing(2, 1000, 25);**

**Otto.moonwalker(5, 1000, 40, 1);**

**Otto.moonwalker(5, 1000, 40, -1);**

**Otto.crusaito(5, 1000, 40, 1);**

**can Otto talk?**

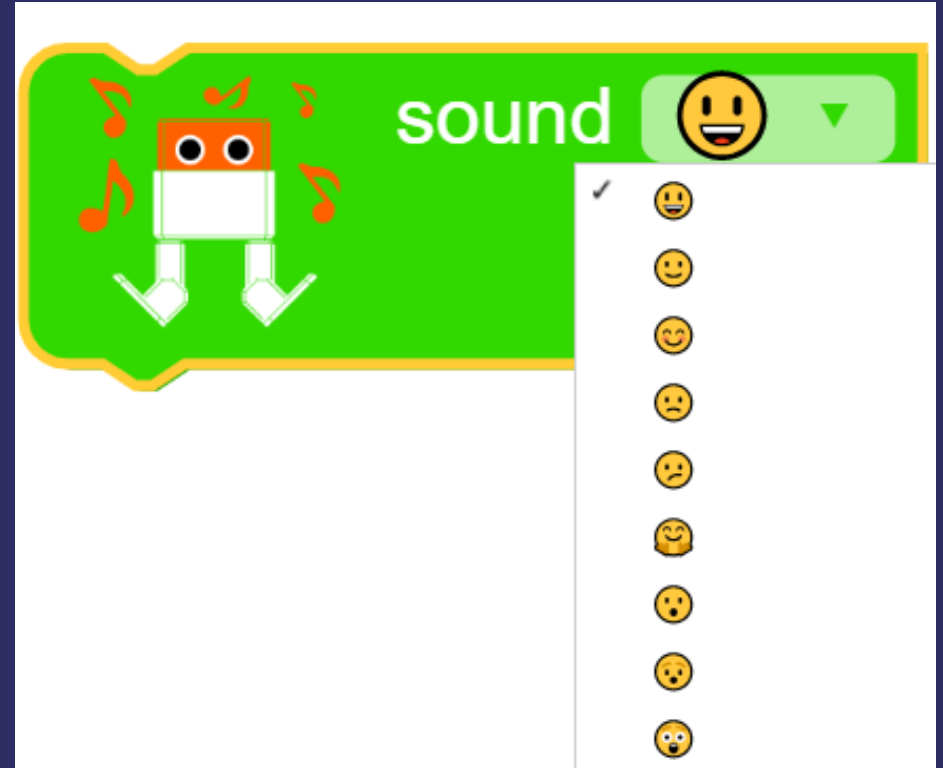

## piezo buzzer

is an actuator used to generate sound, beep or even make the melody of a song.

Otto can't talk but he can create sounds related to his emotions similar to R2D2.

make sure to identify the positive mark and connect in the right pin

`Otto.sing(S_superHappy);`

**what is a gesture?**

**movements + sounds  
to generate emotions  
or multiple moods.**

```
Otto.playGesture(OttoLove);  
Otto.playGesture(OttoSuperHappy);  
Otto.playGesture(OttoSad);  
Otto.playGesture(OttoSleeping);  
Otto.playGesture(OttoConfused);  
Otto.playGesture(OttoAngry);  
Otto.playGesture(OttoMagic);  
Otto.playGesture(OttoWave);  
Otto.playGesture(OttoVictory);  
Otto.playGesture(OttoFail);  
Otto.playGesture(OttoFart);
```

**how does Otto “see”?**

## ultrasonic sensor

is used to measure the distance to an object by using ultrasonic waves, includes 4 pins:

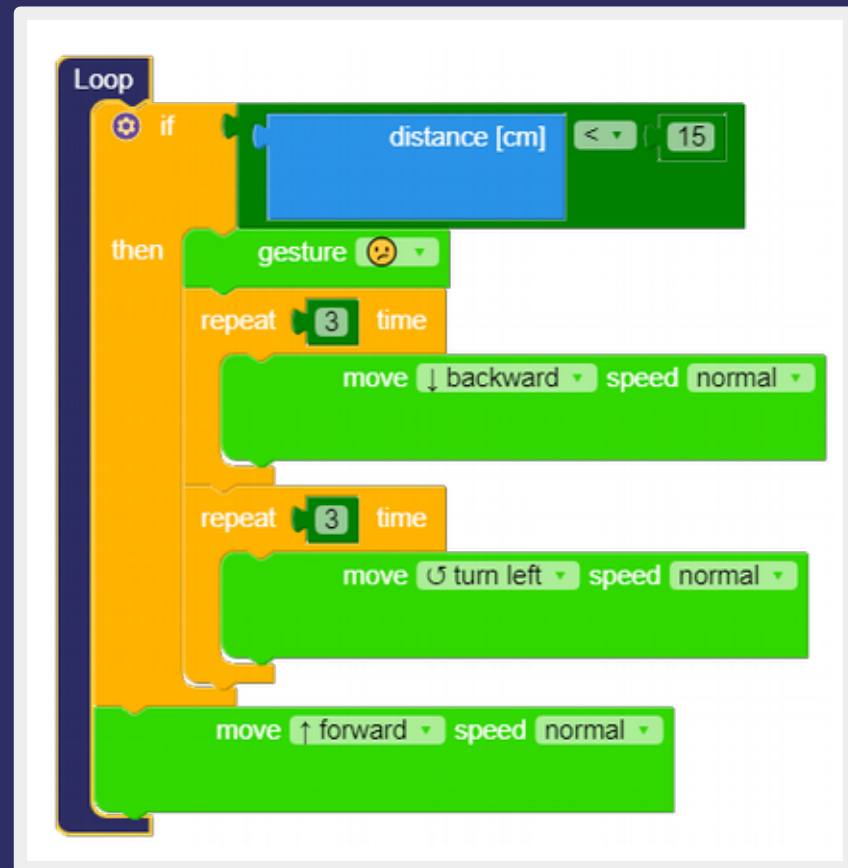

**VCC (Power), GND (Ground)**

**TRIG** receives the control signal

**ECHO** sends a signal (pulse)

by measuring the duration of pulse we can calculate the distance.

**Otto can avoid obstacles!**

**what will you code?**

# other components & interactions

touch & sound sensors and LED matrix displays. (depends on the robot kit)

### Alkaline batteries option

OK as start

### Ni-Mh rechargeable option

but for better performance and  
care of the environment, use  
rechargeable batteries.

more detail info here:

# troubleshooting & debugging

find and fix, perseverance is important.

not finding Otto connected in your PC?  
install the CH340 driver to recognize USB device.

can not upload code?  
check USB cable and that Bluetooth is disconnected

does Otto reset every now and then?  
that is because of lack of power, discharged batteries.

are Otto legs and feet twisted?  
check that you centered your servos before assembly for  
precise movements calibration is needed read this blog  
article: <https://www.ottodiy.com/blog/calibration>

ask for help in the community forum : <https://wikifactory.com/+OttoDIY/forum>
